

UL 325 STANDARD - TECHNICAL DATA SHEET

UL 325 is the standard that addresses the automatic operation of garage doors that contains provisions related to the automatic operation of gates. In this Technical Data Sheet, we will provide you with some background information about UL and UL standards and will notify you of the current gate-related aspects of UL 325.

What is UL Underwriters Laboratories, Inc.?

UL Underwriters Laboratories Inc. is a not-for profit organization established in 1894, which is self-described as “the leading third party certification organization in the United States and the largest in North America.” UL’s primary stated mission is “to evaluate products in the interest of public safety.” There are other testing laboratories and certification organizations in the United States.

What are UL Standards?

UL standards are voluntary standards that establish minimum requirements and are developed via an open, non-exclusionary process. “Voluntary” means that the standard has not been initiated through any government or similar regulatory agency mandate. “Minimum” means that the industry and those who developed the standard believe that the requirements should be met by all participants affected by the standard, and that more stringent provisions may be adopted by some in the industry. Finally, an “open, non-exclusionary process” indicates that any interested party can participate in the development of a UL standard. In addition, a number of UL standards have undergone a “canvass” (ballot) process in order to obtain recognition as American National Standards. The purpose of this process is to gain a wider acceptance of a specific standard. The canvass process typically includes interested individuals and organizations that may have direct or material interest in a particular standard. UL 325 is one of the standards that have attained an ANSI (American National Standards Institute) designation.

What is the UL 325 Standard For products within the scope of the standard, UL 325?

UL 325 contains the basic qualifying factors that products must meet in order to be documented (listed) and marked (labeled) as complying with the requirements of the UL 325 voluntary Listing and Labeling program. UL 325 provides methods for testing products, primarily related to safety performance. UL 325 covers the installation of products in accordance with the National Electrical Code, which is maintained by the National Fire Protection Association (NFPA) and is in force nationwide. UL 325 is to be harmonized with this code. UL 325 addresses safety concerning potential fire and electrical hazards, as well as the safety of the general public.

The History of UL 325

The first edition of UL 325 was released in 1973. That edition was primarily focused on the electric operation of garage doors and did not contain provisions for gates. After federal laws were enacted in the early 1990s, citing the provisions of UL 325 as applicable to garage door operation, members of the gate operator industry initiated the inclusion of electric gate operator provisions in UL 325. Some government agencies and other interested groups have monitored the standard’s progress and have provided input on the current format of the provisions of the standard that relate to gate operators.

How is UL 325 Utilized?

UL 325 is used as a basis to test products at a nationally recognized testing laboratory. Gate operators that choose to participate in a listing and labeling program submit their products for testing. If they are found to be in compliance with the UL 325 standard, they are “Listed” and receive a “Mark.” Products are not approved by UL or other laboratories. Approval implies acceptance of responsibility for compliance with standards. This responsibility lies with the listing and labeling applicant and not with the laboratory. The burden of proof regarding data always lies with the manufacturer.

UL 325 STANDARD - TECHNICAL DATA SHEET

UL 325 and Gates

Highlights of UL 325 include the following:

- A glossary which defines each type of operator
- Different “classes” of gate operators
- Entrapment* protection criteria for each “class” of operator
- Entrapment* alarm criteria
- Requirements for gate construction and installation (for detailed requirements regarding construction, see ASTM F2200, Standard Specification for Automated Vehicular Gate Construction)
- Instructional requirements placing increased responsibility on installers. In the document, “entrapment” is defined as “the condition when an object is caught or held in a position that increases the risk of injury.”

A key part of the UL 325 standard is a table that summarizes the entrapment device options for different classes of operators of the various types of gates included in the standard. Please refer to the table as you read about the provisions that are described in the following sections.

Usage class	Gate operator category			
	Horizontal slide, vertical lift, and vertical pivot		Swing and vertical barrier (arm)	
	Primary type ^a	Secondary type ^a	Primary type ^a	Secondary type ^a
Vehicular I and II	A	B1, B2, or D	A, or C	A, B1, B2, C, or D
Vehicular III	A, B1, or B2	A, B1, B2, D, or E	A, B1, B2, or C	A, B1, B2, C, D, or E
Vehicular IV	A, B1, B2, or D	A, B1, B2, D, or E	A, B1, B2, C, or D	A, B1, B2, C, D, or E

Note - The same type of device shall not be utilized for both the primary and the secondary entrapment protection means. Use of a single device to cover both the opening and closing directions is in accordance with the requirement; however, a single device is not required to cover both directions. A combination of one Type B1 for one direction and one Type B2 for the other direction is the equivalent of one device for the purpose of complying with the requirements of either the primary or secondary entrapment protection means.

^a Entrapment protection types:

Type A - Inherent entrapment protection system. See 31.1.5.

Type B1 - Provision for connection of, or supplied with, a non-contact sensor (photoelectric sensor or the equivalent). See 31.1.6 - 31.1.9.

Type B2 - Provision for connection of, or supplied with, a contact sensor (edge device or the equivalent). See 31.1.7 and 31.1.10 - 31.1.12.

Type C - Inherent adjustable clutch or pressure relief device. See 31.1.13.

Type D - Provision for connection of, or supplied with, an actuating device requiring continuous pressure to maintain opening or closing motion of the gate. See 31.1.14 and 31.1.15.

Gate Definition and Types

UL 325 defines a gate as “a moving barrier such as a swinging, sliding, raising, lowering, rolling, or the like, barrier that is a stand-alone passage barrier or is that portion of a wall or fence system that controls entrance and/or egress by persons or vehicles and completes the perimeter of a defined area.” The main types of gate operators/systems addressed in UL 325 are barrier, vertical pivot gate, horizontal slide gate, swing gate and vertical slide gate. It is important to note that all gates included in UL 325 are defined as vehicular gates and not pedestrian gates. Property owners are expected to provide a separate entrance for pedestrian access. Gate Operator Classifications Four distinct types of classifications have been established:

UL 325 STANDARD - TECHNICAL DATA SHEET

Gate Definition and Types (cont'd)

- Class I: Residential usage, covering one to four single-family dwellings.
- Class II: Commercial usage where general public access is expected; a common application would be a public parking lot entrance or gated community.
- Class III: Industrial usage where limited access is expected; one example is a warehouse property entrance not intended to serve the general public.
- Class IV: Restricted access; this includes applications such as a prison entrance that is monitored either in person or via closed circuitry.

UL 325 defines the allowable entrapment protection options for each class as follows:

- Each class must have primary and secondary entrapment provisions;
- Each class must have different types of protection for the different classes of operators as well as for the different categories of operators; and
- The same type of device cannot be used for both primary and secondary protection.

An exception to compliance with the provisions of Table 31.1 has also been noted in the standard.

An operator considered exempt would require all of the following:

1. Operates a vehicular barrier (arm) that is not intended to move toward a rigid object closer than 2 feet;
2. does not have a pinch point between moving parts by virtue of the operator's design or complying installation; and
3. Is not required to be provided with means to protect against entrapment.

Provisions Regarding Gate Operators

Notable provisions included in UL 325 that affect gate operators and related safety devices. Class I and Class II operators must have an audio alarm which shall function if 2 sequential activations of the entrapment protection device occur. The "2 sequential activations" is noteworthy in that it is hoped that "nuisance" alarms will be kept to a minimum while still providing safe operation.

1. Class I and Class II slide gate operators shall not exceed a speed of 1 foot per second when the operator is pulling 75 pounds or more. Since both classes listed involve general public usage, this maximum established speed strikes a balance between any perceived security issue (a person immediately following the party controlling the gate) and any danger from a person being struck by a gate.
2. A Type B1 or B2 device serving as a Primary Safety Device shall be monitored for the presence and correct operation of the device, including the wiring to it, at least once during each open and close cycle. This requirement is included because these types of safety devices are often used as backup safety devices.
3. Manufacturers will be required to specify a brand and model number of external sensors compatible for connection to an operator. This provision arose from concern over the gate operator external devices acting in tandem as a system, with a fault rate of 6 failures in 1 million hours of use (which equates to 115 years of continuous operation).
4. After sensing an obstruction, reversing must begin within 2 seconds. This requirement is intended to keep a person from being entrapped in a stationary position by the gate system. After the first contact the gate must reverse and travel a minimum of 2 inches. If there is a second contact, the gate must stop, and requires a wired device to reset the operator.
5. After any obstruction reversal by either an A or B2 device, the timer-to-close is disabled until reset. Both A and B2 devices sense direct gate contact with an obstruction, and the devices must perform their intended function without interference from a timer-to-close action.
6. Stop the gate upon sensing a second sequential obstruction, and then not operate until an intended hard wired input is received in most situations, depending upon the combination of types of primary and secondary entrapment protection devices that are used. A person within the line of sight of the gate must see what has caused the second sequential obstruction and must resolve this obstruction before operating the gate.

UL 325 STANDARD - TECHNICAL DATA SHEET

7. If a Type C device is chosen, swing gates must not exert more than 40 pounds of force after initial start-up. The reasoning here is similar to the reasoning given for the speed limitation for horizontal slide gates.

UL 325 Effect on Installations

These provisions will have several effects on gate and fence dealers and installers:

1. Gate and fence dealers should look for an indication of the Class of each operator, which will be specified by the gate operator manufacturer.
2. Fence dealer sales personnel must match the site application with the Class of operator. The gate operator manufacturer should be contacted if there is any question about the site application.
3. Both primary and secondary safety devices must be provided and matched to both the operator and site conditions. Although the gate operator manufacturer will either provide or specify these devices, the gate/fence dealer should insure that they are installed and correctly matched. Any questions should again be directed to the gate operator manufacturer.
4. Warning signs must be permanently affixed to the gate panel. UL 325 includes specific requirements on the format, content, and placement of these signs.

Also Related to Gate Construction and Installation

- Vehicular gate operators should ONLY be used on vehicular gates and never pedestrian gates.
- Adequate clearance should be provided between a swinging gate and adjacent structures to reduce risk of entrapment.
- A sliding gate should work smoothly with easy rolling/movement in both directions, prior to the installation of the operator.
- Controls should be as far away from the gate as possible, at least 6 feet from the gate, to prevent “reach through” occurrences.
- Warning signs and placards must be installed and be visible in the area of the gate.

Device-Specific Installation Instructions

There are also specific installation requirements for certain types of entrapment protection devices. These specific requirements emphasize the care and attention that each device must be given prior to and during installation. For gate operators utilizing non-contact sensor devices (Type B1), instructions should be consulted for placement for each application, care should be exercised to reduce the risk of nuisance tripping, and one or more of these devices must be installed where the risk of entrapment or obstruction exists. For gate operators utilizing contact sensor devices (Type B2), several requirements are spelled out in UL 325.

One or more contact sensors shall be located:

- At the leading edge, the trailing edge, and also post-mounted both inside and outside of, a vehicular horizontal slide gate;
- At the bottom edge of a vehicular vertical slide gate; and
- At the entrapment point of a vehicular vertical pivot gate.

A wired contact sensor shall be located, and its wiring arranged, so that communication between sensor and gate operator is not subjected to mechanical damage. A wireless contact sensor shall be located where the transmission of the signals is not obstructed or impeded by building structures, natural landscaping or similar obstructions, and shall function under the intended end use conditions.

For gate operators utilizing a continuous pressure activating device (Type D), controls must be placed so that user has full view of the gate area when the gate is moving. A placard must be placed adjacent to the controls and no other activation device shall be connected. Most importantly, an automatic closing device shall not be employed.

UL 325 STANDARD - TECHNICAL DATA SHEET

Manufacturer's Instructions Concerning Installation

Gate and fence dealers can expect to see in gate operator instructions the following statements:

1. The operator must be appropriate for the construction of the gate and the usage class of the gate. The appropriate primary and secondary safety devices to be used are a major consideration to support this requirement.
2. **All openings of a horizontal slide gate, and the portion of the fence where the slide gate passes, must be guarded or screened. These specific requirements in UL 325 that govern this provision were developed to address "reach-through" occurrences. For example, slide gates must have a protective cover 48 inches in height extending from the bottom of the gate/fence panel.**
3. All exposed entrapment points must be eliminated or guarded. It is up to individual gate and fence dealers to identify these points on a product-by-product basis, or on a job-by-job basis.
4. Guarding must be supplied for exposed rollers. Exposed rollers are regarded as potential pinch points.

Gate and Fence Dealer Documentation

Dealers and installers should visually document, either via photography or video, the complete gate installation including applicable signs and labels, and the owner receiving the instruction manual from the installer. Other options can include the development and use of an installation checklist, a customer sign-off form, and a service/preventive maintenance contract.

For Gate Operators Manufactured after January 12, 2016

Entrapment-Protection Devices

Gate operators are required to have a minimum of two independent means of entrapment protection where the risk of entrapment or obstruction exists. A manufacturer can use two inherent-type systems, two external-type systems, or an inherent and an external system to meet the requirement. However, the same type of device cannot be used for both means of protection.

Monitoring Required

An external non-contact sensor or contact sensor may be used as a means of entrapment protection. However, the sensor must be monitored once every cycle for (1) the correct connection to the operator and (2) the correct operation of the sensor. If the device is not present, not functioning, or is shorted, then the gate operator can only be operated by constant pressure on the control device. Portable wireless controls will not function in this case.

Entrapment Risk Identification

As in the past, it's up to the installer to examine the installation and determine where a risk of entrapment or obstruction exists. Manufacturers are required to provide instructions for the placement of external devices, but they give only examples of suggested entrapment protection in their installation manuals. If the installer identifies a risk of entrapment or obstruction, at least two independent means of entrapment protection are required.

Terminology Change

The terms "primary" and "secondary" have been removed in the description of entrapment protection devices. This was done to emphasize that all entrapment protection devices are equally important.

UL 325 STANDARD - TECHNICAL DATA SHEET

The End of Type E

Type E (audible alarm) devices can no longer be used for entrapment protection. This change was made because the Type E device is really a warning device, not an entrapment-protection device. Also, all gate operator classes are now required to have an audio alarm that sounds when two successive obstructions are encountered via a contact-type system.

Access Control Location for Emergency Use

An exception has been added in the manufacturer’s instructional requirements for the location of controls that operate the gate. The instructional requirements state that these controls must be at least 6' away from any moving part of the gate. In the new exception, “Emergency access controls only accessible by authorized personnel (e.g., fire, police, EMS) may be placed at any location in the line-of-sight of the gate.”

Barrier-Arm Operator Exception

An exception has changed for barrier-arm gate operators requiring entrapment protection. The previous exception stated that a barrier-arm operator did not require entrapment protection if the arm did not move toward a rigid object closer than 2'. The distance has been reduced to 16" so it more closely aligns with the industry-defined entrapment protection provisions in ASTM F2200.

Gate Operator Class II and Class III Definitions

The definitions for installation classes for gate operators were modified. Class II now includes commercial locations accessible to the general public. Class III was refined to specify industrial locations not accessible to the general public. These changes, while seemingly minor, may affect which gate operator is suitable for a particular installation location.

Meeting Requirements for Normal Operation		
Operator Type	Single Sensor Method	Two Sensor Method
Slide	<ul style="list-style-type: none"> Photo Eye, long range, to span both directions of gate travel (powerful through beam Photo Eye required) 	<ul style="list-style-type: none"> Photo Eye Open & Photo Eye Close <i>OR</i> Edge Sensor Open & Edge Sensor Close <i>OR</i> Photo Eye Open & Edge Sensor Close <i>OR</i> Edge Sensor Open & Photo Eye Close
Swing	<ul style="list-style-type: none"> Photo eye Close Edge sensor (wrap around type) for both directions of gate travel (requires Miller MGR or MGS edge) Edge Sensor Open or Edge Sensor Close 	<ul style="list-style-type: none"> Optional
Vertical Lift	<ul style="list-style-type: none"> Photo Eye Close <i>OR</i> Edge Sensor Close 	<ul style="list-style-type: none"> Optional
Barrier Arm	N/A (not required when there is no risk of entrapment from barrier arm, provided that the barrier arm does not close within 16" of a rigid object.) Sensors used for "object" detection do not require monitoring.	

Normal operation allows momentary inputs and all automatic features.

If any direction of gate travel is not protected with a sensor, that direction will require a constant hold command.
